

SORTING ALGORITHM

1 Sorting algorithm by replacement

1. **Initialization:** To have a table T unsorted n element and a table A n element initially empty.
2. **Main loop:** For each element i in A to 1 in n:
 - To find a minimum T and index.
 - Copy minimum in A[i].
 - Replace this minimum by maximum in T. (this is a trick to ward re-select this element)

2 Sorting algorithm by select

1. We go through the table from second element. (The first element always is considering as sorted)
2. For each element, we compare it a element always sorted (in left) and we square it in appropriate position.
3. We repeat this operation until all element are sorted.

3 Sorting algorithm by bubbles

1. We go through the table left to right.
2. Compare each element with follow.
3. If element is bigger than element follow, exchange them.
4. Repeat step 1 to 3, until all element are sorted.
